

Effectiveness of the design interface

- Include mobile interface design.

Algorithm Design

- Errors should loop back to the step that caused the error, not the start of the process.
- Every decision path in a flowchart must either rejoin the main flow or end clearly.
- Use a visual display symbol when dealing with output (DISPLAY ".....") - Input/Output symbol (parallelogram)

The design of data requirements

- Copy my task 1 'Project Data' (ERD & Tables) and just relabel the section as 'Data Requirements'

The test strategy

- Include more testing types, such as acceptance testing, alpha/beta testing, and black box and white box testing.
- Consider integration testing, perhaps?
- Must show the type of testing

Type of test: Normal Data ❌

Type of test: Front-end testing (Normal data) ✔️

The design documentation

Usecase

- Use more advanced UML features
